EthiViz Analysis Report

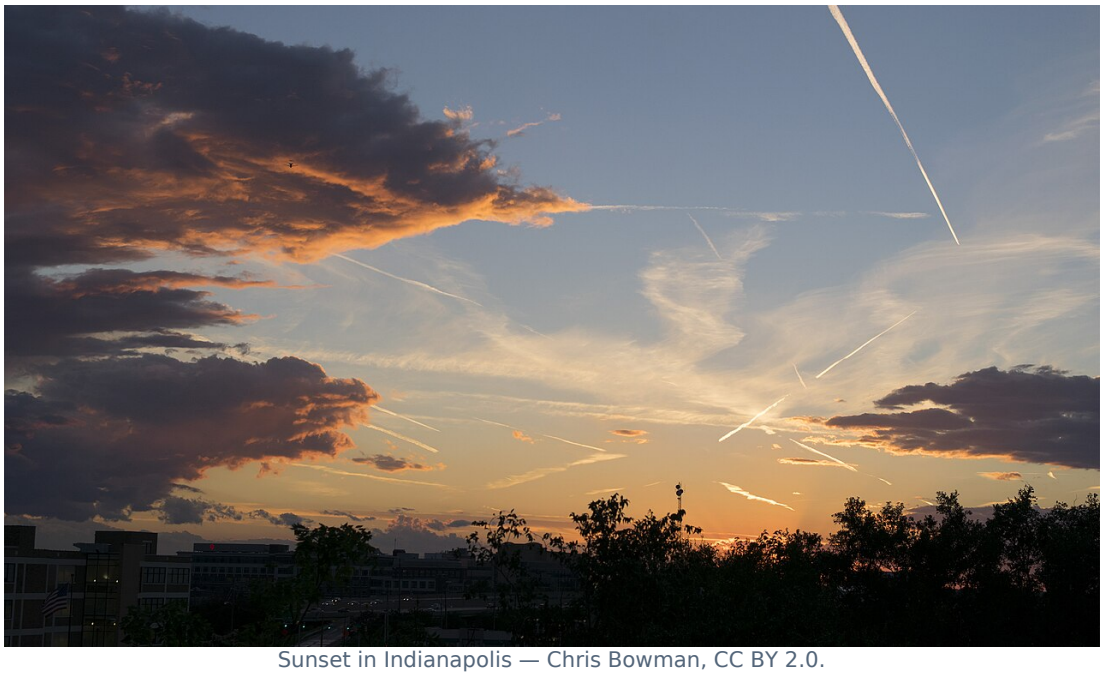

Cross-cultural analysis of one text file and one image file

Job status	Completed	Job ID	96dc87c6-816a-4276-ace7-b35f572cbc0e
Analysis mode	Text + image	Perspectives	7 ethical lenses
Text units	301	Image	1280 x 749 px

Inputs and sources

Text: A Modest Proposal by Jonathan Swift, Project Gutenberg eBook 1080; 19,612 bytes (19.2 KiB). Project Gutenberg plain-text download. Public-domain work in the United States.

Image: Sunset in Indianapolis, photographed by Chris Bowman on 2014-10-07; 135,217 bytes, JPEG. Wikimedia Commons file page. Licensed CC BY 2.0; attribution to Chris Bowman.

Run summary

The completed job analyzed the complete downloaded text file as 301 input segments and processed one image through the platform image pipeline. Its returned image analysis reports 0 detected faces and 3 cultural-element/object detections. The API response retains counts, but not the detector labels for those elements.

Platform results

The first table reproduces the API job-level tradition scores. EthiViz emits these as calibrated/overall framework scores; in this combined job they are averaged across the text and image modality outputs.

Ethical lens	Job-level score	Severity	Confidence
Western	0.3842	high	0.7920
Buddhist	0.0109	unknown	0.7920
Hindu / Dharmic	0.0019	unknown	0.7920
Indigenous / First Nations	0.0018	unknown	0.7920
Ubuntu	0.0017	unknown	0.7920
Confucian	0.0010	unknown	0.7920
Islamic	0.0000	unknown	0.7920

Text segment score distribution

The next table summarizes the per-segment scores returned for the text file. These raw per-text scores are a separate output from the calibrated/overall job-level scores above, so they are not directly comparable.

Lens	Mean	90th pct.	Maximum	Non-zero segments
Western	0.0048	0.0146	0.0756	114 / 301
Ubuntu	0.0034	0.0127	0.0619	67 / 301
Confucian	0.0020	0.0087	0.0430	71 / 301
Islamic	0.0000	0.0000	0.0023	1 / 301
Buddhist	0.0057	0.0190	0.0886	104 / 301
Hindu / Dharmic	0.0037	0.0138	0.0639	82 / 301
Indigenous / First Nations	0.0035	0.0115	0.0943	86 / 301

Image score output

Image signal	Returned value
Bias score	0.0039
Western lens	0.0109
Ubuntu lens	0.0000
Confucian lens	0.0000
Islamic lens	0.0000
Buddhist lens	0.0161
Hindu lens	0.0000
Indigenous lens	0.0000

Cross-cultural dimension findings

The engine returned 10 construct readings, 0 consensus findings, 0 tradition-specific findings, 0 conflicts, and 0 synergy amplifications. No consensus or tradition-specific findings were reported for this run; that is a null detector result, not evidence that the work contains no ethically relevant material.

Interpretation and limits

Text: this is a single 18th-century satirical work. The detector may score literal language without recognizing irony or the author's satirical intent; the output is a screening signal, not a contextual literary judgment. The platform's job-level scores and per-text item scores are distinct aggregates and should not be read as one common scale.

Image: the detector reported counts only; the API did not return names or confidence values for the three detected elements. The lens scores are calculated from the detector-generated description, rather than a direct ethical reading of the pixels. Treat these as exploratory model outputs.

EthiViz scores are decision-support signals, not determinations of legal compliance, proof of bias, or a substitute for domain and community expertise. This report is based on one sample per modality.

Correction: Image Detection Count

This clarification supersedes the image-count statements on pages 1 and 3 of this report.

The earlier run reported “3 cultural-element/object detections.” That value was produced by counting the detector’s category keys, not individual detected items. It is not a verified count of objects or cultural elements.

The earlier API response also did not preserve the detector labels, so the specific labels and the corrected item count cannot be recovered from this report alone. Do not interpret “3” as a valid detection count.

The V7 implementation now counts detected items within the category lists, returns the detected labels, and distinguishes completed, failed, and unavailable detection. A new run is required to obtain corrected counts and labels for this image.
